

AMENDMENTS TO THE CLAIMS

(IN FORMAT COMPLIANT WITH THE REVISED 37 CFR 1.121)

1. (PREVIOUSLY PRESENTED) A method for generating a superset pinout for a family of devices, comprising the steps of:

(A) defining a pinlist for each device within said family of devices, wherein said family of devices comprises devices having either (i) different numbers of high-speed transceiver channels, (ii) different functions of high-speed transceiver channels or (iii) different numbers and functions of high-speed transceiver channels;

(B) generating a superset listing of pins from said pinlist for each device within said family of devices;

(C) creating said superset pinout for said family of devices from said superset listing of pins to eliminate potential footprint variations within said family of devices; and

(D) marking each pin of said superset pinout associated with each member of said family of devices.

2. (PREVIOUSLY PRESENTED) The method according to claim 1, wherein step (D) further comprises:

customizing a superset grid representing said superset pinout according to said superset listing of pins.

3. (PREVIOUSLY PRESENTED) The method according to claim 2, wherein said customizing comprises:

marking a specific pin in said superset grid for each member of said family of devices.

4. (ORIGINAL) The method according to claim 1, wherein said family of devices comprises devices with combined programmable logic and high-speed serial channels.

5. (CANCELED)

6. (CURRENTLY AMENDED) The method according to claim 1, wherein step (C) further comprises:

~~eliminating using said superset pinout to eliminate potential layout variations within said family of devices with said superset pinout.~~

7. (PREVIOUSLY PRESENTED) The method according to claim 1, wherein step (B) further comprises:

combining pins shared by more than one member of said family of devices.

8. (ORIGINAL) The method according to claim 1, wherein step (C) further comprises:

allocating a pin for each signal in said pinlist.

9. (PREVIOUSLY PRESENTED) The method according to claim 1, wherein step (C) further comprises:

providing a common footprint for each member of said family of devices.

10. (PREVIOUSLY PRESENTED) The method according to claim 1, wherein step (C) further comprises:

designing a board layout (i) to accommodate more than one member of said family of devices and (ii) to allow for a change 5 from one member of said family of devices to another member of said family of devices without affecting said board layout and without external components.

11. (PREVIOUSLY PRESENTED) The method according to claim 1, wherein step (C) further comprises:

limiting each pin of said superset pinout to a single function.

12. (CANCELED)

13. (PREVIOUSLY PRESENTED) The method according to claim 1, wherein step (D) further comprises:

marking one or more pins of said superset pinout no-connect for a particular member device.

14. (CURRENTLY AMENDED) The method according to claim 1, wherein said family of devices further comprise programmable logic devices and high-speed serial channel devices.

15. (CURRENTLY AMENDED) The method according to claim 14, wherein said family of devices further comprises devices with one or more sets of 2.5 Gbps transceiver channels ~~capable of operating at 2.5 Gbps.~~

16. (PREVIOUSLY PRESENTED) The method according to claim 14, wherein said family of devices further comprises one or more devices having higher gate densities than other members of said family of devices.

17. (PREVIOUSLY PRESENTED) The method according to claim 14, wherein said family of devices further comprises one or more devices having increased bandwidth channels.

18. (CURRENTLY AMENDED) The method according to claim 1, wherein ~~said the devices having~~ different functions of high-speed transceiver channels ~~further comprises comprise~~ devices having Infiniband compliant functions and SONET compliant functions.

19. (PREVIOUSLY PRESENTED) An apparatus for generating a superset pinout for a family of devices comprising:

means for defining a pinlist for each device within said family of devices, wherein said family of devices comprises devices having either (i) different numbers of high-speed transceiver channels, (ii) different functions of high-speed transceiver

channels or (iii) different numbers and functions of high-speed transceiver channels;

means for generating a superset listing of pins from said 10 pinlist for each device within said family of devices;

means for creating said superset pinout for said family of devices from said superset listing of pins, wherein said superset pinout eliminates layout changes when migrating between devices within said family of devices; and

means for marking each pin of said superset pinout associated with each member of said family of devices.

20. (CURRENTLY AMENDED) A ~~device configured to generate computer readable medium having instructions for causing a computer to execute a method for generating~~ a superset pinout for a family of devices, wherein said ~~device is further configured to method comprises the steps of:~~

~~define defining~~ a pinlist for each device within said family of devices;

~~generate generating~~ a superset listing of pins from said pinlist for each device within said family of devices;

10 ~~create creating~~ said superset pinout for said family of devices from said superset listing of pins; and

~~mark marking~~ each pin of said superset pinout associated with each member of said family of devices, wherein said family of devices comprises two or more devices having either (i) different numbers of high-speed transceiver channels, (ii) different 15

functions of high-speed transceiver channels or (iii) different numbers and functions of high-speed transceiver channels and said superset pinout is configured to reduce layout and footprint changes on a board configured to connect to each member of said family of devices.
